

Education

- 2021–2025 : **Ph.D. in Computer Engineering**, *Northeastern University*, Boston, USA.
2018–2020 : **Masters of Science in Computer Engineering**, *Southern Illinois University Carbondale*, IL.

Skills

- Languages Python, C++, Java/Android, Bash, SQL, HTML, CSS
Tools XCAL-Accuver (5G/LTE signaling message analysing tool) || Keysight RuSIM || Spectrum Analyzer || Git || Wireshark || Scikit-Learn || PyTorch || Keras || SoA Machine-Learning Frameworks || Video Streaming tools (Puffer, FFmpeg)
Platform Linux || Android || Docker || Cloud (AWS, GCP)
Protocols NR/LTE 3GPP standards || TCP/MPTCP/UDP protocols and their implementation (Linux Source Codes) || IEEE
Standards 802.11 ax/ac/ad/b/g/n standards

Experience

- 2026 – 2026 **Research Engineer**, *AT&T Labs. Inc.*, contract.
◦ Developed a production-ready anomaly detection pipeline for E911 network KPIs using a lightweight Isolation Forest model, enriched with SIP/CCDR protocol context, including message types, cause codes, and failure indicators. Engineered historical baseline features using z-scores, rolling means, and rolling standard deviations to identify KPI degradation, achieving 90% anomaly correlation with known network incidents.
◦ Benchmarked graph-based SSB optimization approaches using Google OR-Tools and SCIP on production network inventory data, incorporating neighbor weights to evaluate optimization performance in terms of execution time, number of configuration changes, and iterations required to reach optimality.
- 2021 – 2023 **Research Intern and External Collaborator**, *AT&T Labs. Inc.*
◦ Investigated the impact on QoE of low-latency video streaming over 5G networks in a joint collaboration work with Facebook.
◦ Published a peer-reviewed conference paper correlating radio link dynamics with application-layer KPIs to proactively mitigate User Quality of Experience (QoE) degradation.

Selected Projects

X5G: O-RAN compliant 5G Testbed Development, *NSF Funded*.

- OAI
C++
O-RAN
NVIDIA ARC
- Contributed to the development of X5G: an O-RAN compliant multi-vendor (NVIDIA, OAI, Foxconn) programmable testbed for research.
 - Instrumented OAI code for performance tuning, configuration tweaking, and KPI extraction.
 - Developed measurement report and event (A3) handling mechanism for Xn-handover.
 - Improved system throughput by 20% by debugging and bug reporting to Nvidia Aerial and OAI team.
 - Published 1 Conference and 1 Journal Paper.

5G measurement studies on user-perceived performance, *NSF Funded*.

- 5G/LTE
Python
X-CAL
Puffer
FFMPEG
- Designed and executed large-scale mobility measurement campaigns (multi-city/cross-country drives), integrating synchronized application-level tests with cellular KPIs for holistic analysis.
 - Assessed 5G coverage, throughput, latency, and user Quality of Experience (QoE) using large-scale dataset [10TB+].
 - Built an end-to-end measurement and QoE extraction pipeline for modern interactive applications, including AR/VR, 360° video streaming, and cloud gaming.
 - Developed tools to extract lower-layer (PHY/MAC/RLC) KPIs from 5G control-plane signaling (RRC) [XCAL logs].
 - Investigated key 5G mechanisms—handovers, uplink power control, and advanced features (carrier aggregation, beam-forming, MIMO) to identify performance bottlenecks and explain observed behavior.
 - Built automated Python pipelines for data cleaning, feature extraction, and statistical analysis; produced publication-quality figures and reproducible artifacts.
 - Open-sourced **datasets/scripts** and created replication-friendly workflows to enable follow-on studies.
 - Published 8 conference papers.

5G/LTE Python Machine Learning	Throughput prediction in operational 5G networks, CISCO Funded.	
	o	Collected a fine-grained, real-world dataset during a 4-day (1000+ km) drive, measuring bidirectional application throughput at 100 ms time-scales across all three major U.S. operators and mixed LTE/5G deployments.
	o	Evaluated multiple predictors (MLP, GDBT, transformer-based MVTs) alongside statistical baselines (EWMA, last-value) and showed that low RMSE can still yield poor application-centric accuracy (e.g., high ARE95 / low PARE10).
	o	Used over-parameterized neural networks as a “learnability test” and found slow training convergence and persistently high validation/test error, indicating fundamental limits to fine-grained throughput predictability.
	o	Identified the root cause as conflicting sample sequences—highly similar recent histories followed by drastically different next-sample throughput—explaining why models must learn spiky functions and generalize poorly.
JAVA Android Python AWS Machine Learning	5G Performance Evolution Study, NSF Funded.	
	o	Built an IRB-approved Android measurement app (NextG-UP) to collect uplink TCP throughput and RTT alongside cellular KPIs (GPS, RSRP/RSRQ/RSSI, Cell-ID, ARFCN/EARFCN, operator); implemented nuttcp (10s UL test) + ICMP ping (11 packets @200ms) with a lightweight footprint (6.5MB APK, <250MB RAM).
	o	Deployed a geographically distributed measurement backend (AWS servers in N. Virginia, Oregon, Frankfurt + AWS Wavelength inside Verizon’s network in Boston) and integrated nearest-server selection + mobility modes (static/walking/driving).
	o	Led a cross-sectional, year-long 5G uplink campaign with weekly volunteer measurements: 10,166 tests across 8 cities in 7 countries (2 continents), covering 12 operators and 1,422 unique cell IDs.
	o	Quantified “deployment maturity” and found stagnation over one year (no clear throughput/latency trend) and inconsistent 5G advantage over LTE (e.g., 5G throughput lower in 1 city; 5G latency lower than LTE in only 3/8 cities).
C Python TCP MPTCP Android Kernel tc 802.11	Multipath TCP (MPTCP) for Dual-band 802.11ad + 802.11 ac networks, NSF Funded.	
	o	Ported MPTCP source code to a commercial dual-band smartphone (802.11ad@60 GHz + 802.11ac@5 GHz) by integrating 15,000+ LOC into the Android Linux kernel; released the implementation publicly for reproducible experimentation.
	o	Built an experimental pipeline to measure 100 ms -granularity throughput and on-device power draw, enabling a first look at both <i>performance</i> and <i>energy</i> of MPTCP on resource-constrained phones.
	o	Identified and implemented key system-level optimizations for Gbps MPTCP on smartphones (e.g., enabling GRO and CPU/SIRQ affinity to big cores), achieving near sum-rate performance across the two radios under ideal conditions.
	o	Quantified throughput–energy tradeoffs across packet-scheduling ratios and derived practical guidelines toward an energy-aware MPTCP scheduler for dual-band mmWave/legacy Wi-Fi phones.
	o	Released two custom kernels with MPTCP stack for ASUS ROG II and Pixel 5 .
